## Applications of Noise Reduction

- Image enhancement
- Preprocessing step to other techniques (e.g. segmentation, edge detection)

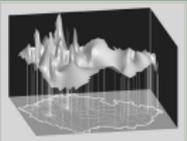

## Noise Reduction via Wavelet Shrinkage

- + Recovering signals from additive Gaussian noise
- Thresholding w. coefficients without considering their dependencies  $\Rightarrow$  artifacts, blurred edges

## Noise Reduction via Wavelet-Based HMTs

- Hidden Markov Tree (HMT) models
- Aiming to capture these dependencies

## Interdependencies of the DWT Coefficients

- Shrinkage methods assume the DWT to de-correlate signals thoroughly (incorrect)
- DWT coefficients reveal **clustering** and **persistence**

## Persistence & Clustering Properties

- Clustering within scale
  - We expect large (small) coefficients in the vicinity of a large (small) coef.
- Persistence across scale
  - Parent-child relations
  - We expect a large (small) parent coef. to have large (small) children
- Both captured by the HMT models

## The Overall PDF

$$f(w_i) = p(S_i = m) f(w_i | S_i = m)$$

- $p(S_i = m) \dots$  PMF of the hidden states  $\sum_{m=1}^M p(S_i = m) = 1$
- $f(w_i | S_i = m) \dots$  conditional probability of the coefficients value  $w_i$  given the state  $S_i$  corresponds to  $G(\mu_{i,m}, \sigma_{i,m}^2)$

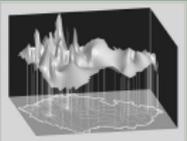

## Transition Probabilities

- Children hidden states  $S_i$  given the parent state  $S_{p(i)}$

$$f(S_i = m | S_{p(i)} = n) = \begin{bmatrix} f(S_i = 1 | S_{p(i)} = 1) & f(S_i = 1 | S_{p(i)} = 2) \\ f(S_i = 2 | S_{p(i)} = 1) & f(S_i = 2 | S_{p(i)} = 2) \end{bmatrix}$$

- For  $M = 2$  (2-state model)
- Persistence  $\Rightarrow f_{1,1} \gg f_{2,1}, f_{2,2} \gg f_{1,2}$

## Noise Reduction Experiments

- HMT models outperform the NormalShrink method (at the expense of greater computation cost)
- NormalShrink causes artifacts and blurs edges

## Future Work

- Our experiment have been very limited so far
- Next step: Carry out more experiments on biomedical image data
